SUMMARY

Designing and developing web sites for 7 years, I have worked a multitude of roles. From graphic design and front-end development to general server administration and back-end troubleshooting, I have been exposed to a diverse range of environments and languages. My strengths lie in site frameworks – taking designs and converting them to CMS templates (namely WordPress), as well as front-end development (mainly HTML/CSS/Bootstrap). I also have moderate experience with PHP and light UI-focused Javascript/jQuery. I have recently been exposed to Ruby on Rails, SVN/Git, and Linux environments, all of which I am eager to continue moving forward with. The majority of my work thus far has been solo freelance, catering to small-business clients. I'm now ready to move into a more robust and permanent team-based position in which I can utilize my full skill set in a professional environment while picking up new technologies, frameworks, and languages along the way. My skills are best suited for a junior to mid-level developer position, with heavy emphasis on front-end technologies.
